

Light Truck Engineering

PROGRAM REPORT

Date February 5, 1981

SUBJECT: Revised Stability Index for Utility

Objective:

Review alternatives to increase stability index.

Background:

The stability index of Ranger vehicles is generally at or below median levels to comparable vehicles (Attachment I). A study of methods to improve stability index for the Bronco II has resulted in several design alternatives to achieve an improvement of Bronco II stability index from 1.85 to a maximum achievable of 2.25 without a totally new concept vehicle.

Summary:

The study revealed that increased mass or revised component center of gravity locations resulted in small increases in stability index. These types of improvements were not adopted as part of the final proposals. However, if these revisions were adopted, they would be additive. Attachment II provides details of these effects. One adverse effect found was a reduction in stability index of 0.10 by adding 130# of luggage with the RPO roof mounted rack.

In order to improve stability index substantially, the following are required:

- .Widened track width
- .Lower center of gravity achieved by raising the wheel center lines with the respect to body with trade-off's in ground clearance and vehicle package.

Discussion:

Attachment III describes five (5) alternatives to increase the stability index. All proposals assume the maximum tire will be restricted to a P205 x 15. These proposals are summarized as follows:

Proposal 1

Increases front track to 55.9" by reducing wheel offset 0.5". Increase rear track to 56.6" by increasing rear axle length 1.5" and use the revised offset wheels. The vehicle height will be reduced 0.5" in the front by restricting jounce and the rear ride to curb will be reduced 0.5" by increasing spring rates. This proposal provides a stability index of 2.02. The offset wheels and front vehicle height revisions can be used on the current P/U 4x4. The rear height of the P/U 4x4 will be reduced 0.5" by revising the spacer height. This proposal results in a unique rear axle for the Utility. The P/U 4x4 stability index is 2.01 with this proposal.

Model	Investment	Piece Cost	Weight	Timeline
Ranger 4x4	-	\$1.50	2.0*	1983
Bronco II	\$4.0 million	4.00	(10.0)	1983½

Proposal 2

Increases front track to 56.4" by lengthening front axle 0.25" per side and using the revised offset wheels in Proposal 1. All other changes are the same as Proposal 1. This results in a stability index of 2.03 on the Bronco II. The increased front track in this proposal will result in a 1.3" "dog track" in the P/U 4x4. The P/U 4x4 stability index is 2.02 with this proposal.

Plaintiff's Exhibit

000000399

7

<u>Model</u>	<u>Investment</u>	<u>Piece Cost</u>	<u>Height</u>	<u>Timing</u>
Ranger 4x4	\$12.00	2.0#	1983	
Bronco II	\$4.0 million	\$3.50	(11.0#)	1983½

Proposal 3

This proposal maximizes the vehicle track with a small reduction in height. Thus, providing maximum ground clearance and only minor body sheet metal tear-up. This alternative results in an index of 2.09. The change described in this proposal would be unique to the Utility and could not be incorporated into the 4x4 for Job #1, 1983. The required revisions in this proposal are widen frame siderails, revise front radius arm and axle length, and revise front axle carrier position to widen track on both axles to 58.0". Investment (\$10.1 million); piece cost (\$11.0#); weight (41.0#); timing - Job #1, 1983½ (potential risk on release and samples).

Proposal 4

This utilizes the same track increase in Proposal 3 and a 1.36" height reduction. The resulting stability index is 2.19. This proposal has rear body and seating package revisions as well as increased frame vertical offset of 1.36" at the front and increased rear frame height by 1.36". The rear spring will have 2" of negative camber. These changes could not be incorporated into the P/U 4x4 for Job #1, 1983. Investment (\$13.1 million); piece cost (\$54.00); weight (113.0#); timing - Job #1, 1983½ (potential risk on release and samples).

Proposal 5

Reduces vehicle height an additional 1.0" from Proposal 4 for a stability index of 2.25. This proposal has major front and rear sheet metal revisions and results in a vehicle height only 0.5" higher than a 4x2 pick-up due to 15" vs. 14" tires on 4x4 vs. 4x2. This requires increased frame vertical offset of 2.36" at the front and 1.36" at the rear but with a 3" negative camber of the rear spring. These changes could not be incorporated into the P/U 4x4 for Job #1, 1983. Investment (\$13.8 million); piece cost (\$54.00); weight (113.0#); timing - Job #1, 1983½ (potential risk on release and samples).

Open Issues:

General Open Issues:

Attachment IV provides an open issues list for the five proposals and identifies the open problems requiring detail study and resolution. Proposal 1 and 2 have the fewest issues with the wheel durability prove-out and sign-off timing being the most critical.

Ground Clearances:

Attachment V compares ground clearances for various proposals and shows the primary trade-off's in approach and departure angles with the extremes of lowering the vehicle center of gravity.

Commonality:

Proposal 1 or 2 can be incorporated in the P/U 4x4 for Job #1, 1983. These proposals will result in a unique rear axle for the Utility.

All other proposals result in significant vehicle tear-up to incorporate them into the P/U 4x4 and cannot be contained within Job #1, 1983 P/U 4x4 timing.

0000003400

Recommendations:

- Proceed with Proposal 2 revisions to the Utility and the P/U 4x4 to maximize stability index and meet reasonable cost and timing constraints.
- Delete the roof mounted luggage rack as an RPO due to adverse effect on stability index.
- Establish and initiate a joint Design/Development work plan to achieve desired lateral acceleration gains in the Utility vehicle.

BRONCO II HIGH UTILITY
(With Driver)

Action	Vertical CG	Stability Index
<u>Base</u> Updated vehicle with current weights and vertical CGs of all components, including wrap-over glass and updated interior trim; 54.5 average track, maximum optional tire LT215/15.	29.40	1.85
<u>Proposal 1</u> . Revised front ride height by restricting jounce 0.5", reduce rear rise-to-curb by 0.5"; increase front track by 1.0" with 0.5" offset wheels change to obtain a front track of 55.9"; increase rear track by 1.0" with 0.5" offset wheel change and increase axle width by 1.5" to obtain a rear track of 56.6" for an average track of 56.25". . Restrict maximum option tire from LT215/15 to P205/15 M-S.	28.56	1.97
	27.85	2.02
<u>Proposal 2</u> . Same as the first proposal except widen front axles 0.25" per side to obtain a front track of 56.1" for an average track of 56.5". . Restrict maximum option tire from LT215/15 to P205/15 M-S.	28.56	1.98
	27.85	2.03
<u>Proposal 3</u> . Revised front ride height by restricting jounce 0.5", reduce rear rise-to-curb by 0.5", increase track by 3.07" front and 3.86" rear to 58.0" average track. . Restrict maximum option tire to P205/15 M-S.	28.56	2.03
	27.85	2.09
<u>Proposal 4</u> . Same as first proposal except lower front and rear ride height 1.36" additionally (1.86" front and 1.36" rear). . Restrict maximum option tire to P205/15 M-S.	27.20	2.13
	26.49	2.19
<u>Proposal 5</u> . Same as second proposal except lower front and rear ride height 1.00" additionally (2.86" front and 2.36" rear). . Restrict maximum option tire to P205/15 M-S.	26.44	2.19
	25.73	2.25

BRONCO II/RANGER 4x4
Recommended Stability Index Improvement Proposal

	Bronco II	Ranger 4x4
<u>STABILITY INDEX</u>	2.03	2.02
<u>VEHICLE CHANGES</u>		
• FRONT TREAD	56.4"	56.4"
	Increased 1.0" via reducing wheel offset by 0.5" plus an additional 0.5" in axle width increase.	
• REAR TREAD	56.6"	55.1"
	Increased 1.0" via reducing wheel offset by 0.5" plus an additional 1.5" in axle width increase.	
• VERTICAL CO	27.9	27.6
	Reduction of front ride height by 0.5" thru jounce restriction; reduced rear ride height by 0.5"; and restrict maximum tire to P205/15 M&S.	
<u>PROGRAM PARAMETERS</u>		
• Piece Cost	\$3.50	(\$2.00)
• Tooling	(\$1.5 MIL)	Included
• Engineering	(\$2.5 MIL)	Included
• Total Investment	(\$4.0 MIL)	Included
• Weight	(11.0 lbs.)	2.0 lbs.
• Ground Clearance	Reduced by 0.5" (Front)	Reduced by 0.5" (Front & Rear)
• Timing	Containable for Job #1, 1983½ with potential risk on body-side panel sample (6-8 weeks)	Containable for Job #1, 1983, however, late production wheel availability will delay durability sign-off by approx. two (2) months and will not support the 1-29-82 samples at source date.
